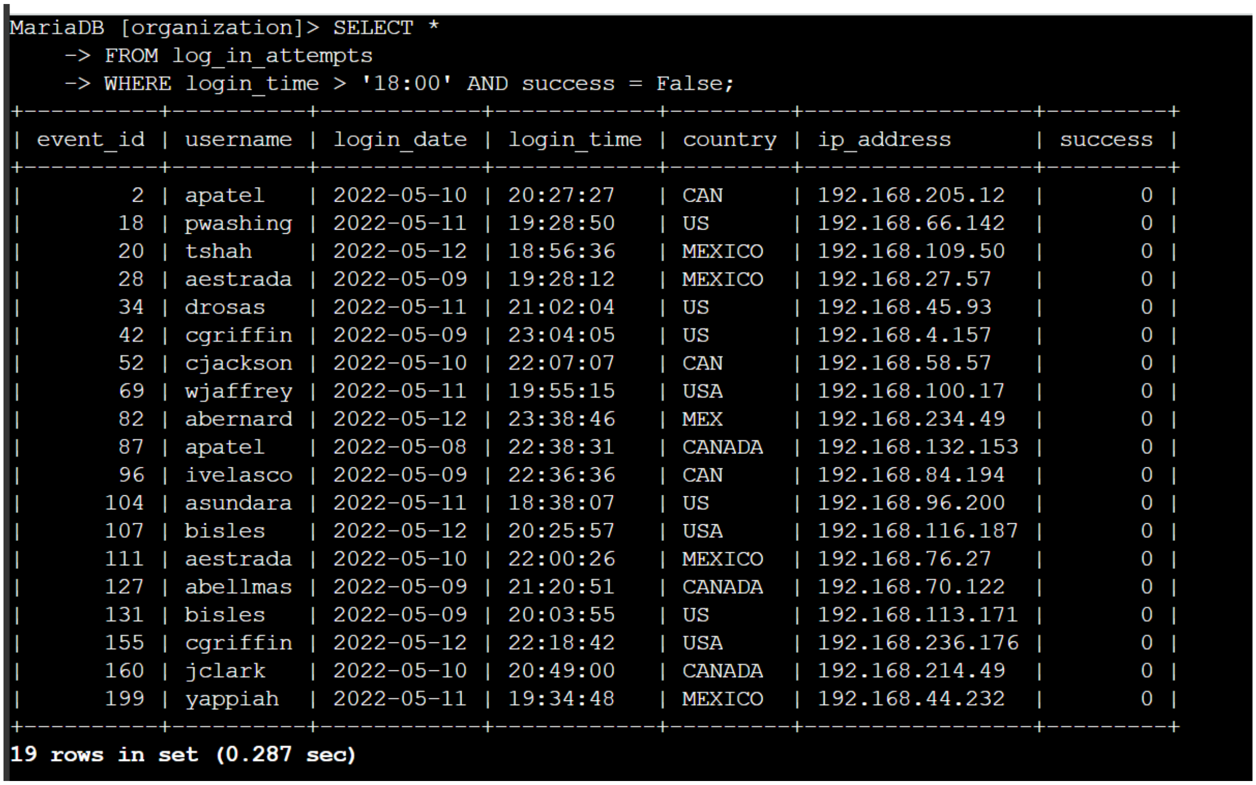
Apply filters to SQL queries

Project description

In this scenario, I am a security professional at a large organization. We recently discovered some potential security problems involving login attempts and employee machines. My task is to examine the organization's data in the *employees* and *log_in_attempts* tables. This task is accomplished using the following SQL queries.

Retrieve after hours failed login attempts

The organization's working hours end at 6 P.M. every day. Our task is to examine any failed login attempts that have occurred outside of working hours. The following SQL query retrieves these attempts and returns a total of 19 rows.



```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00' AND success = False;
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |

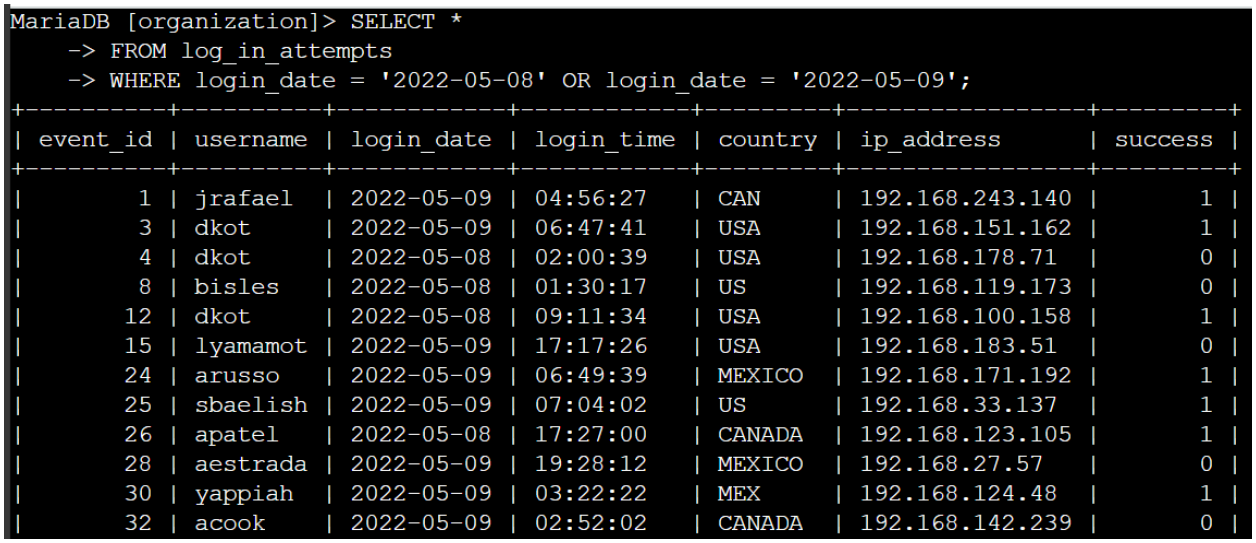
Retrieve login attempts on specific dates

In this case, our task is to retrieve any login attempts that have occurred on either 05/08/2022 or 05/09/2022. In this case, we use the OR clause in our query to get the results for both dates. Another way to return these results would be to use the BETWEEN clause and input our two dates. This would be especially useful if we needed to look through login attempts occurring between a range of dates.



```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_date = '2022-05-08' OR login_date = '2022-05-09';
+----------+----------+------------+------------+---------+-----------------+---------+

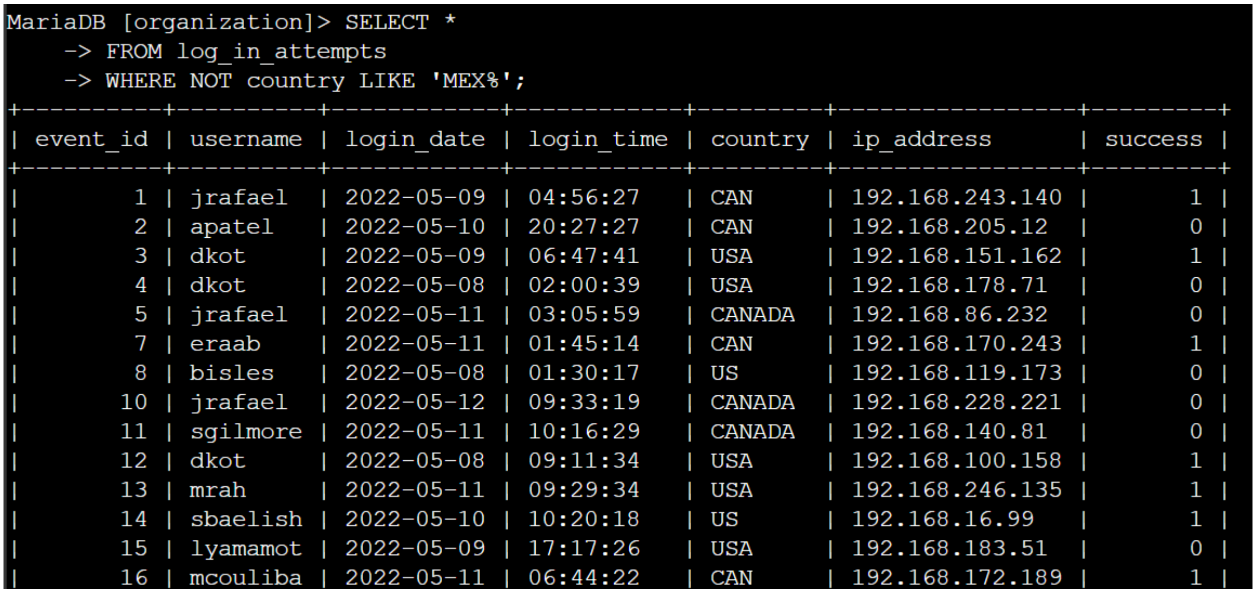
Retrieve login attempts outside of Mexico

In this case, our task is to retrieve any login attempts that occurred outside of Mexico. In order to do so, we use the NOT clause. Additionally, because the country name can be specified by either ‘MEX’ or ‘MEXICO’, we use the LIKE clause and input ‘MEX%’. This will return rows in which the country name starts with ‘MEX’ with any number of additional characters. This allows us to get rows which contain a country name of either ‘MEX’ or ‘MEXICO’.



```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |
+----------+----------+------------+------------+---------+-----------------+---------+

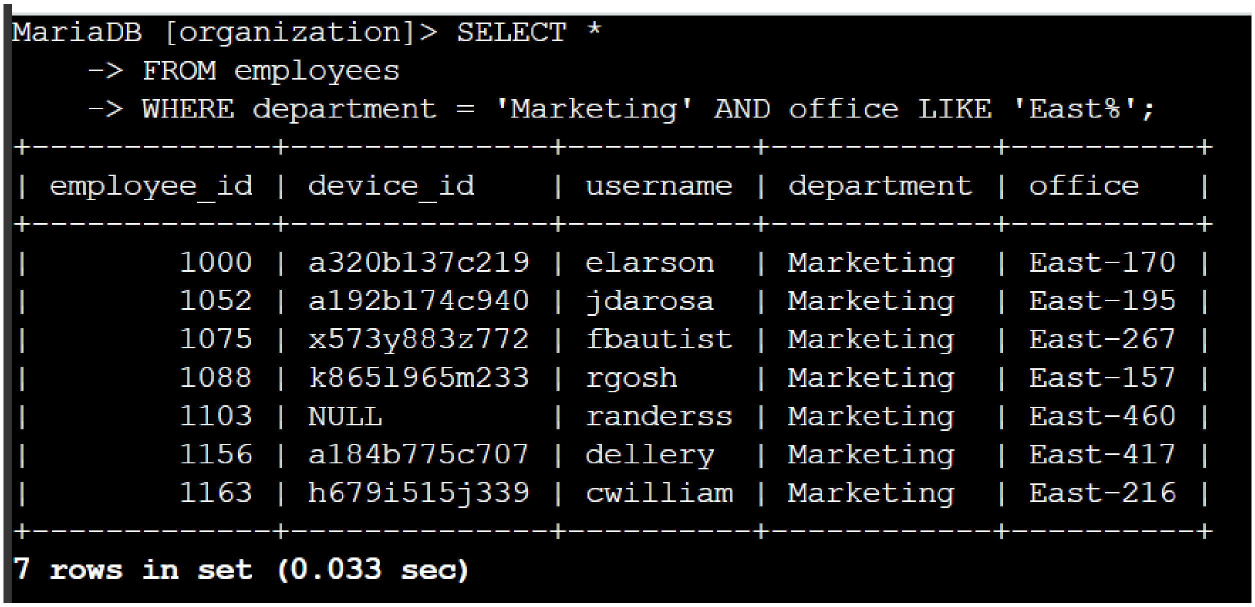
Retrieve employees in Marketing

In this case, we are trying to retrieve employees who work in the marketing department and also work in an office in the east building. Because we are looking for employees in both the marketing department and the east building, we use the AND clause which only returns true if both of the statements also return true. This query also utilizes the LIKE clause since the office column contains both the building and office number. We do this because we do not mind which office number that the employee works in. We only care that the office title starts with ‘East’ indicating that it is located in the east building.



```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Marketing' AND office LIKE 'East%';
+-------------+--------------+----------+------------+----------+
| employee_id | device_id    | username | department | office   |
+-------------+--------------+----------+------------+----------+

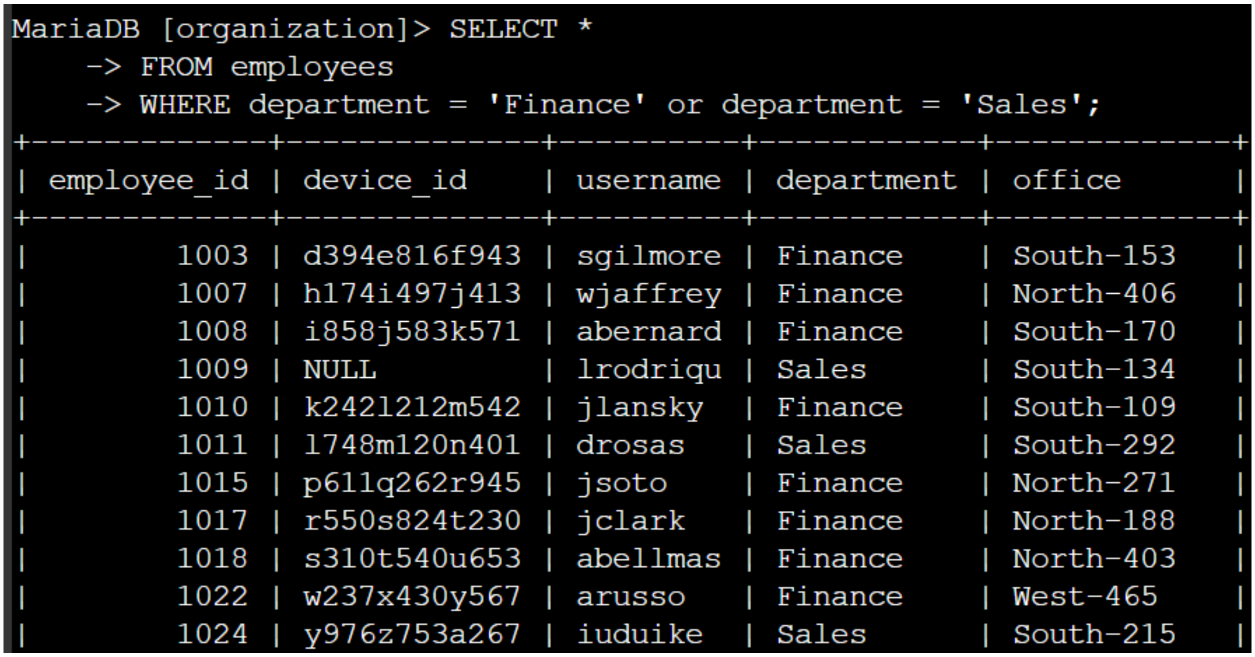
```

Retrieve employees in Finance or Sales

In this case, we want to get all employees in either the finance or sales department. Similar to the second case, we use the OR clause to indicate that we are looking for employees in either department.



```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Finance' or department = 'Sales';
+-------------+--------------+----------+------------+-------------+
| employee_id | device_id    | username | department | office      |

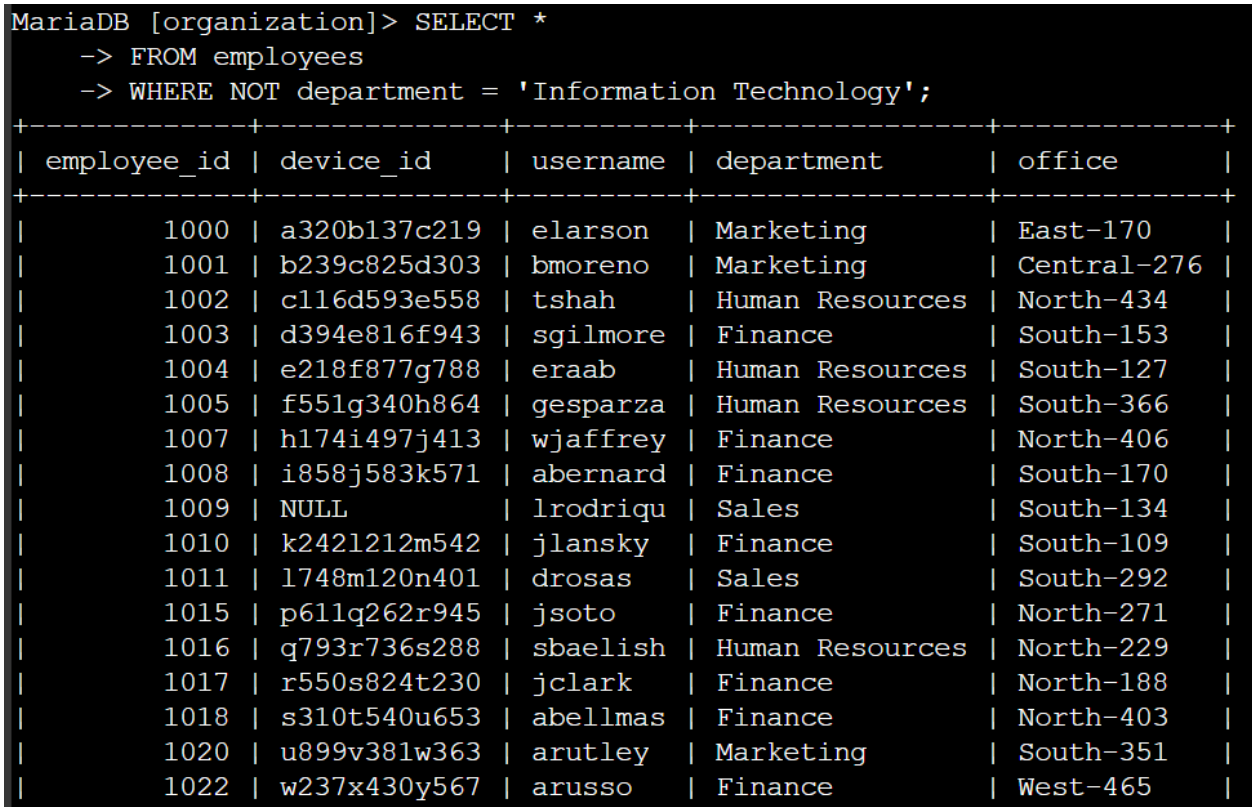
```

Retrieve all employees not in IT

Finally, in this case, we are looking for all employees not in the IT department. We use the NOT clause in this case since we are looking for all employees outside of the IT department.



```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE NOT department = 'Information Technology';
+-------------+--------------+----------+-----------------+-------------+

Summary

Overall, in this activity, I used SQL queries to retrieve data from the *log_in_attempts* and *employees* tables. I used several different clauses in these queries such as the AND, OR, and NOT clauses to filter and retrieve the data that I needed.
